## 1) Parameters in Power BI

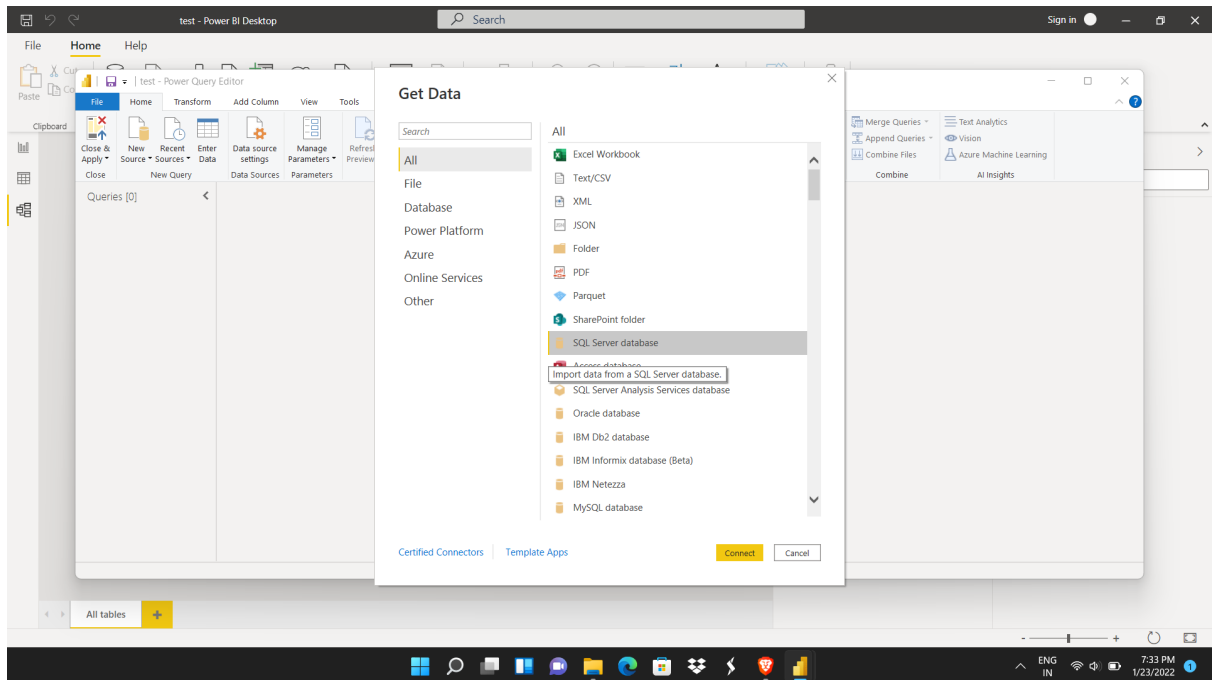

Head to the model tab in Power BI and select transform data

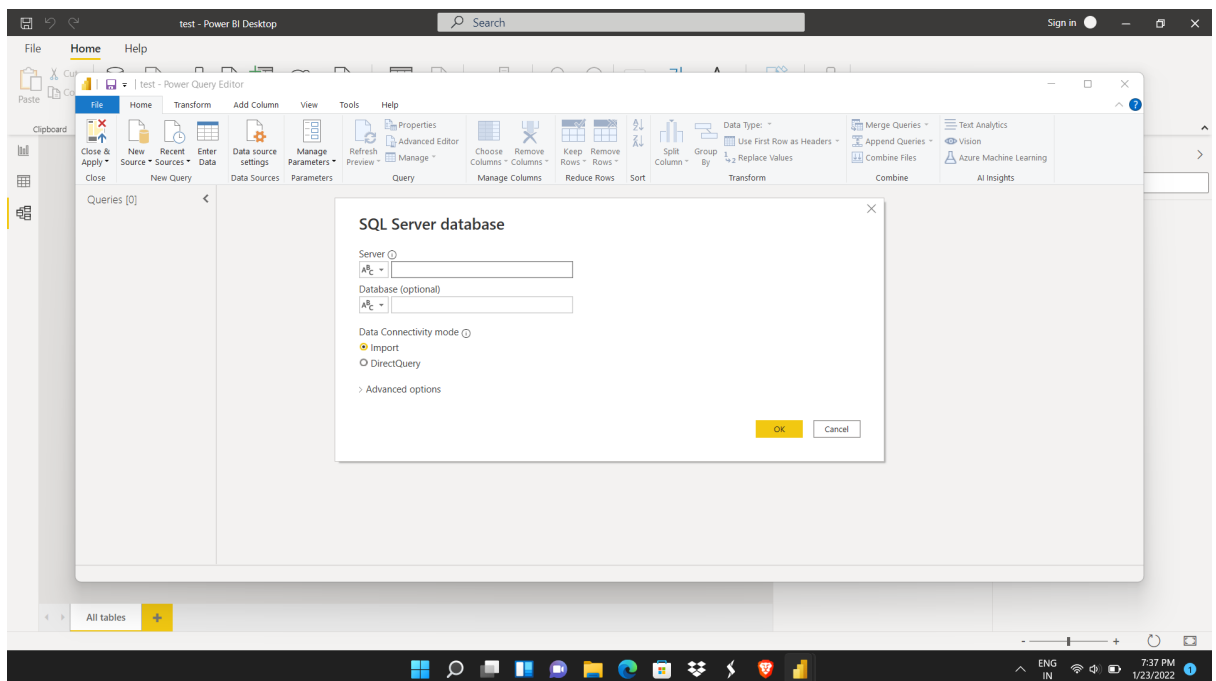

In power query editor head over to view section and check Always allow parameters

Head back over to home in power query editor and select new source and select SQL Server database

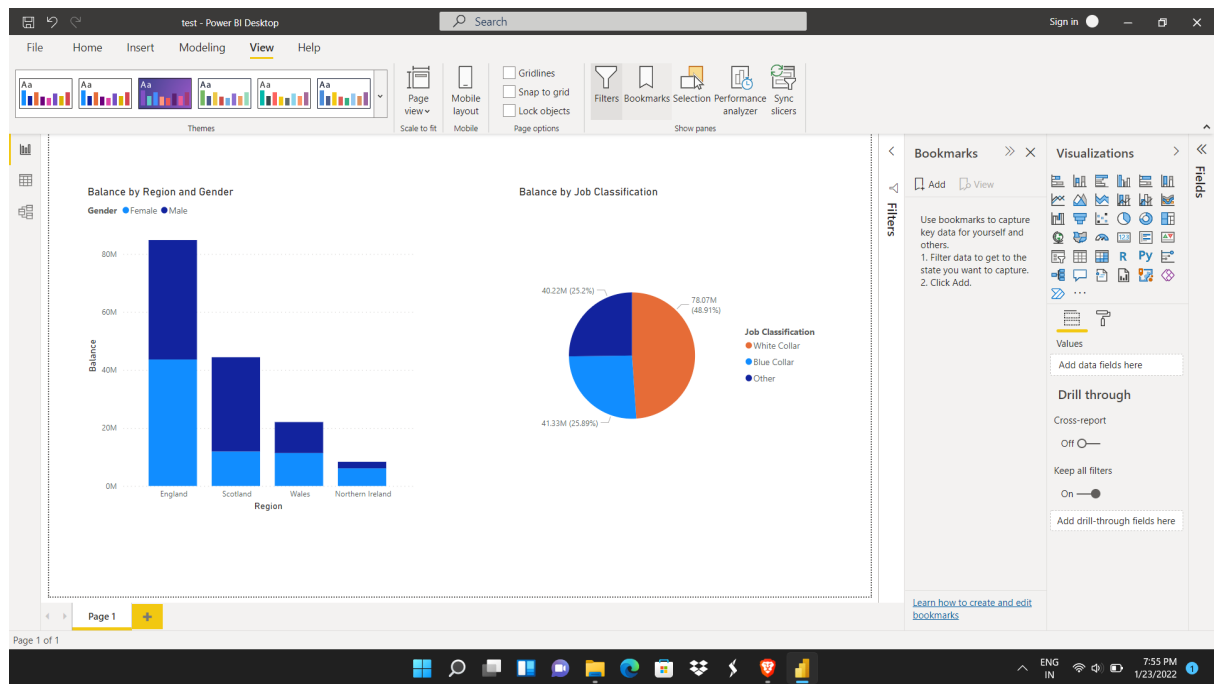

Now we can see, we have dynamic and parameterized option

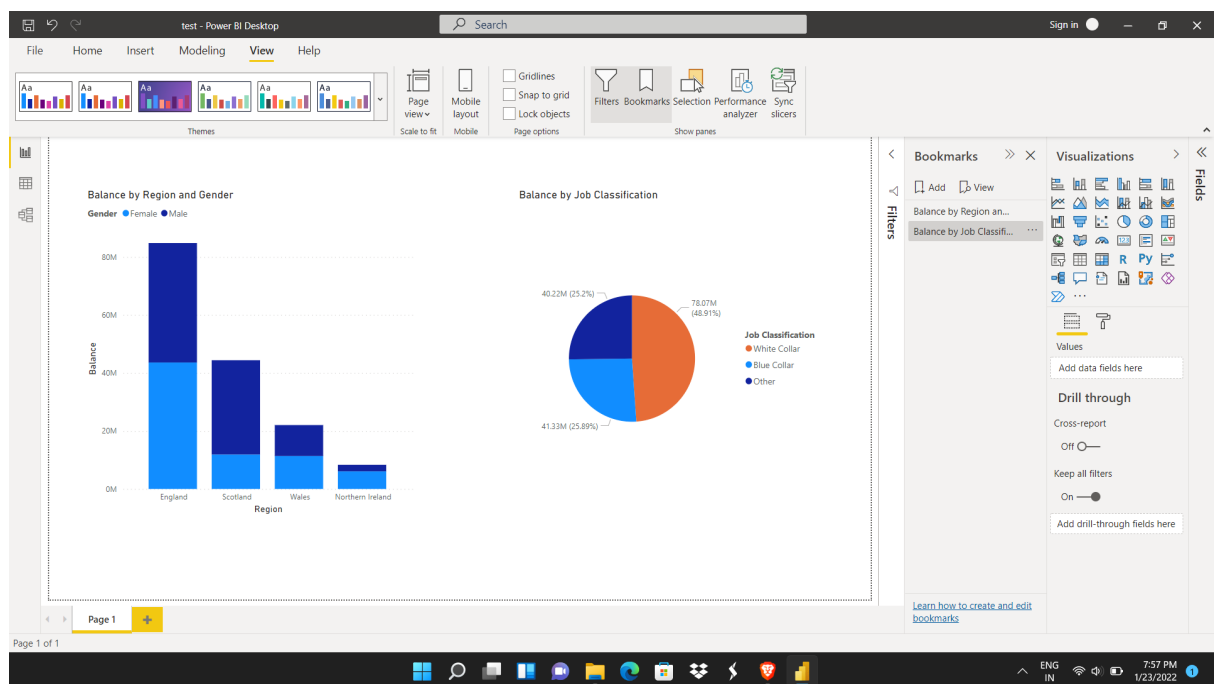

## 2) Bookmarks

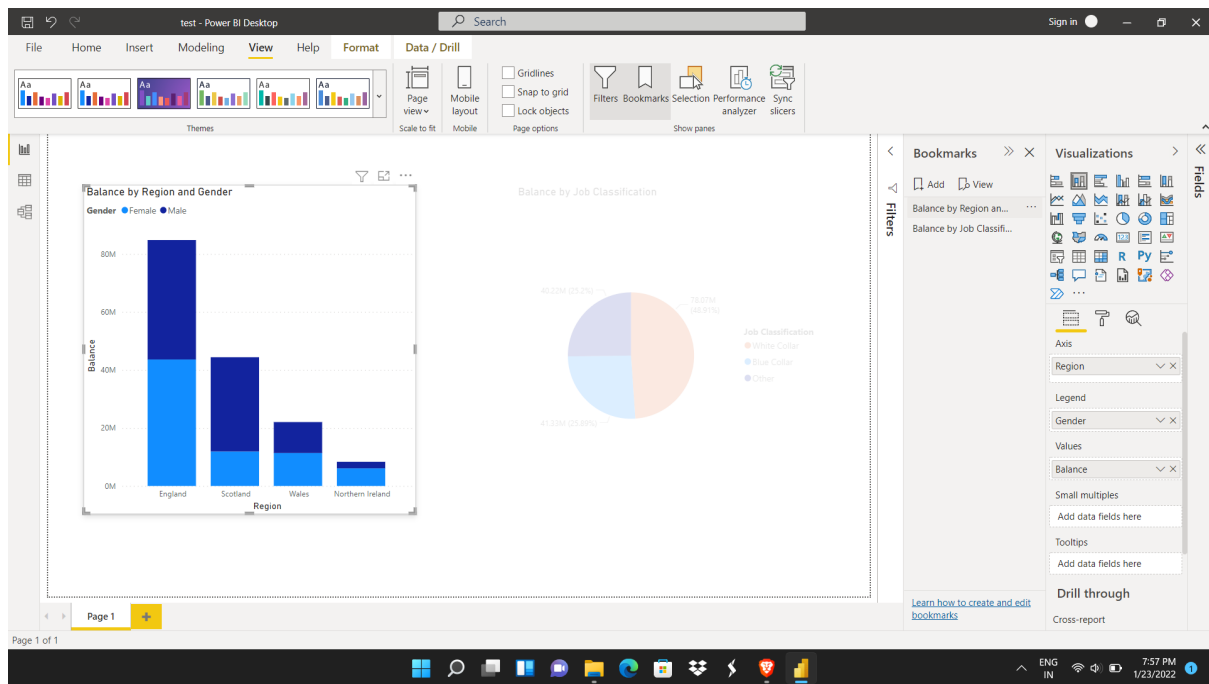

To create a bookmark head over to View section and click on Bookmarks a small column will open on right hand side.

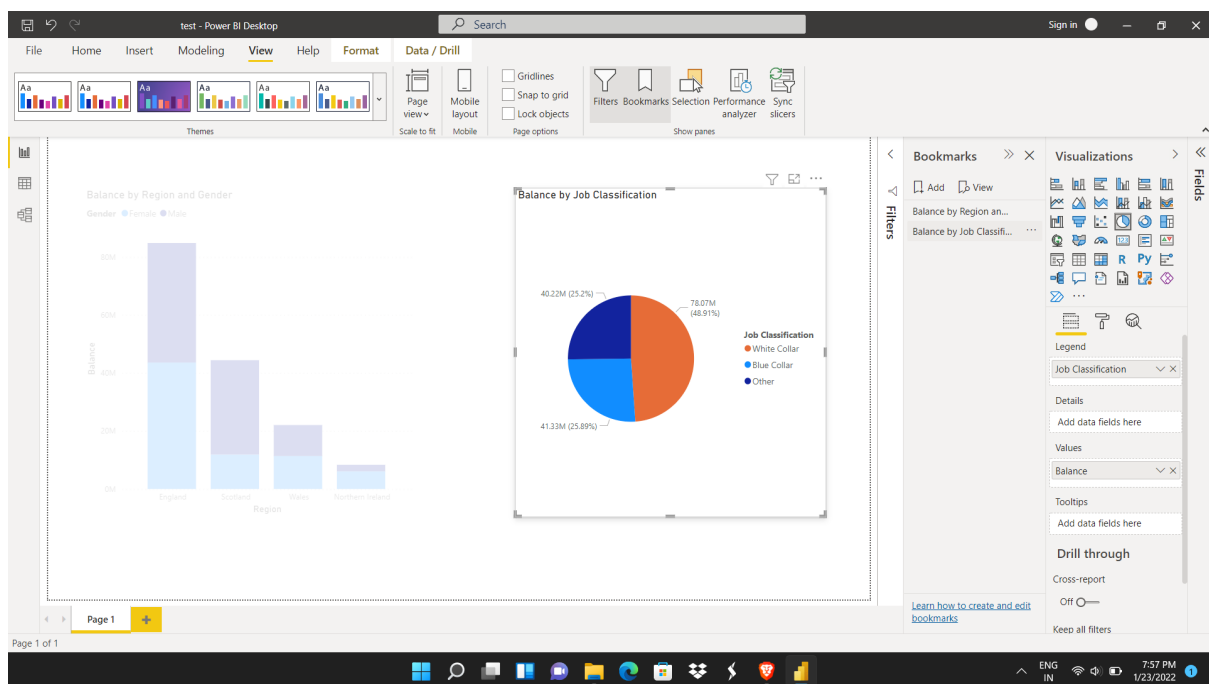

Click on the add button and create bookmarks keeping in mind the changes already made as it will store the present state.

The below image shows the output upon selecting the bookmark named Balance by region and gender.

The below image shows the output upon selecting the bookmark named Balance by Job classification.

### 3) Row level security
